

CARS & ASP

Intercomparison

Liss Andreassen, Joaquín Belart, Etienne Berthier,
Brian Menounos, David Youssefi

Overview of the test:

Four test runs of stereo processing

- CARS (DY)
- ASP-BM (EB)
- ASP-SGM (EB)
- ASP-MGM (JB)

Each run was co-registered with the lidar acquired at the same date (+/- 2 days) using <https://github.com/dshean/demcoreg>

- One large lidar survey in Canada
- Three small lidar surveys in Norway (Gra, HellM, Lan)

A similar statistical analysis was done for the Pléiades Glacier Observatory in this paper: <https://doi.org/10.5194/tc-18-5551-2024>

Overview of results

| | CARS NMAD (m) | ASP-BM NMAD (m) | ASP-SGM NMAD (m) | ASP-MGM NMAD (m) |
|----------------|------------------|--------------------|---------------------|---------------------|
| Canada | 0.59 | 0.59 | 0.46 | N/A |
| Norway (Gra) | 0.25 | 0.25 | 0.22 | 0.22 |
| Norway (HellM) | 0.36 | 0.47 | 0.33 | 0.31 |
| Norway (Lan) | 0.72 | 0.67 | 0.54 | 0.54 |

Other remarks: Hillshades

CARS

ASP-SGM

Challenging areas: Steep areas, shadows, water, trees
ASP leaves them as gaps or with smooth interpolation
CARS produces noisy results in the DEM

CARS

ASP-SGM

Similar visual results in forest

CARS

ASP-SGM

Slight differences in glaciers
"Contour-style" elevations in CARS
Interpolation in water and shadows

Contour-style elevations
